ASSIGNMENT 1

NAME: Sriram Satvik Karanam
USN:25BTRAD049
CLASS:CSE-AIDE-B
SUBJECT: Python Programming

Task 1

Print your

Name

Department

College

Each on a separate line.

Input:

```
print("Sriram Satvik Karanam")
print("CSE-AIDE B")
print("Jain university")
```

Output:

```
Sriram Satvik Karanam
CSE-AIDE B
Jain university
```

Task 2

Print the following pattern.

****

****

****

Input:

```
print("*******")
print("*******")
print(“*******”)
```

Output:
```
*******
*******
*******
```

Task 3

Print the following using a single print() statement.
Python is Easy
Input:

```
print("Python is Easy”)
```

Output:
```
Python is Easy
```

Task 4

Print

1
12
123
1234
12345

Input:
```
print(1)
print(12)
print(123)
print(1234)
```

```
print(12345)
```

Output:

```
1
12
123
1234
12345
```

Task 5

Use \n to print

Computer

Science

Engineering

Input:

```
print("Computer \nScience\nEngeneering")
```

Output:

```
Computer
Science
Engeneering
```

Task 6

Use \t to print

Name Age City

Input:

```
print("Sriram \t18\tHyderabad")
```

Output:

```
Sriram  18      Hyderabad
```

Task 7

Write a Python program with a single-line comment explaining the purpose of the program.

Input:

```
# This program calculates the square of a number.
num = int(input("Enter a number: "))
square = num * num
print("Square =", square)
```

Task 8

Write a Python program using multi-line comments.

Input:

```
"""
This program demonstrates the use of
multi-line comments in Python.
It calculates the sum of two numbers.
"""

num1 = 10
```

```
num2 = 20

sum = num1 + num2

print("Sum =", sum)
```

Output:
```
Sum = 30
```

Task 9

Write a program that contains

- Three comments
- Three print statements

Input:

```
# This is the first comment
print("Hello, Python!")

# This is the second comment
print("Welcome to programming!")

# This is the third comment
print("Have a great day!")
```

Output:

```
Hello, Python!
Welcome to programming!
Have a great day!
```

Task 10

Create a variable called name.

Store your name and print it.

Input:

```
# Create a variable called name and store your name
name = "Sriram"

# Print the name
print(name)
```

Output:

```
Sriram
```

Task 11

Store

10

20

30

in three different variables and print them.

Input:

```
# Store three numbers in three different variables
num1 = 10
num2 = 20
num3 = 30

# Print the three values
print(num1)
print(num2)
print(num3)
```

Output:

```
10
20
30
```

Task 12
Create a program that converts the string "100" into an integer and displays its value and data type.

Input:

```
# Convert the string "100" into an integer
value = int("100")

# Display the value and its data type
print(value)
print(type(value))
```

Output:

```
100
<class 'int'>
```

Task 13
Convert the integer 25 into a float and display the result and its type.

Input:

```
# Convert the integer 25 into a float
value = float(25)

# Display the result and its data type
print(value)
print(type(value))
```

Output:

```
25.0
<class 'float'>
```

Task 14
Accept the user's age using input(), convert it to an integer, and display the age.

Input:

```
# Accept the user's age and convert it to an integer
age = int(input("Enter your age: "))

# Display the age
print("Your age is:", age)
```

Output:

```
Enter your age: 18
```

Task 15
Accept two numbers from the user, convert them to integers, and display their sum.

Input:

```
# Accept two numbers from the user and convert them to integers
num1 = int(input("Enter the first number: "))
num2 = int(input("Enter the second number: "))

# Calculate and display their sum
sum = num1 + num2
print("Sum =", sum)
```

Output:

```
Enter the first number: 12
Enter the second number: 13
Sum = 25
```

Task 16(Using f-string)
Accept a student's name, age and CGPA and display:
My name is Rahul. I am 20 years old and my CGPA is 8.5.

Input:

```
# Accept student's name, age, and CGPA
name = input("Enter your name: ")
age = int(input("Enter your age: "))
cgpa = float(input("Enter your CGPA: "))

# Display the details
print(f"My name is {name}. I am {age} years old and my CGPA is {cgpa}.")
```

Output:

```
Enter your name: Sriram
Enter your age: 18
Enter your CGPA: 8.5
My name is Sriram. I am 18 years old and my CGPA is 8.5.
```

Task 17

Accept temperature in Celsius and convert it into Fahrenheit.

Formula: F = (C × 9/5) + 32
Display the result using an f-string with two decimal places

Input:

```
# Accept temperature in Celsius and convert it to Fahrenheit
celsius = float(input("Enter temperature in Celsius: "))

fahrenheit = (celsius * 9 / 5) + 32

# Display the result with two decimal places
print(f"Temperature in Fahrenheit: {fahrenheit:.2f}°F")
```

Output:

```
Enter temperature in Celsius: 26
Temperature in Fahrenheit: 78.80°F
```

Task 18
Accept an integer and determine whether it is even or odd using the % operator.
Example:
Enter number: 25
Output: 25 is Odd

Input:

```
# Accept an integer and check whether it is even or odd
num = int(input("Enter number: "))

if num % 2 == 0:
    print(f"{num} is Even")
```

```
else:
    print(f"{num} is Odd")
```

Output:

```
Enter number: 22
22 is Even
```
